On demand functionality together with an escapement.
Easy installation, use and maintenance.**

For in-line separation and feeding of compression springs.
On demand functionality together with an escapement.
Easy installation, use and maintenance.

The Tekda SpeedFeeder is delivered with a PLC control that allows queuing sensors and other delivery options to be used. Together with an escapement the springs can be delivered to the assembly point on demand at a given signal through a tube.

The Tekda SpeedFeeder can be equipped with a pen dispenser for easy control of small springs. It can also be equipped with a divider for two or three delivery points as well as a pick-up station with two or three automatic holders respectively.

The output depends on the shape and dimension of the springs. For many types of springs very high capacities are possible. The SpeedFeeder can also be used to serve a manual assembly station.

The Tekda SpeedFeeder is suitable for applications involving cylindrical compression springs with closed end coils.
